

MUSIC MESSAGING FOR THE BRAIN.

Participants needed for a humming task at UCLAN.

A Study in Distraction, Retrieval and Recognition of Music.

Music is part of our daily lives. Music can change our emotions, make us happy or remember something from the past. Music has the power to transform lives.

The aim of this phase of study is to understand how the brain stores music and lyrics, as it appears Alzheimer's patients can recall music when words are lost. You will be asked to complete a listening task which will require you to recognise and hum familiar melodies in quiet and distracted conditions. The task will take about 40 – 60 minutes.

You will need to meet the following conditions to take part:

- **Aged 50+ or aged 18 – 40**
- **Have normal or corrected to normal hearing.**
- **Understand western musical culture.**

If you would like to participate or have any questions about the study, please send an email to RDLinklater@uclan.ac.uk for further information.

..... Thank you for taking the time to read and consider this request
